Improve Accuracy in Operations

Increasing your Perfect Order Rate yields value across your business. Voice-enabling your supply chain apps is a proven way to boost order accuracy with low cost and fast implementation.

With Ivanti Speakeasy deployed on the Velocity platform, businesses achieve:

Improved picking accuracy: Verbal confirmations make it easier for workers to confirm quantities, indicate shortages, and more.

Enhanced worker safety: Workers are able to keep heads-up and eyes-forward, alert to passing forklifts or other environmental hazards.

Faster fulfillment: Having both hands available to pick and package orders, workers complete more orders each shift, elevating operations' metrics on Key Performance Indicators.

More satisfied customers: Delivering orders faster and with better precision builds trust among your customers, improving your reputation and generating more repeat customers.

Voice-directed IoT: Empower workers to dispatch material handling tasks to autonomous mobile robots (AMRs) or audibly request information from other industrial IoT in your operational tech stack.

Lean Six-Sigma Processes: With measurable savings and quality improvements, Ivanti Speakeasy has helped customers certify operations to high quality standards.
